

PVO

Production Value Optimisation

We provide **Production Value Optimisation (PVO) services to clients, ranging in scope from building an entire operating organisation to smaller, bespoke packages of support.**

Our experience sets us apart – we have extensive experience of working in the field, understanding the environment and the mindset. All our people who work with clients have extensive experience working in the field managing operating assets; they understand the environment, the mindset and operating practices.

What approach do we take?

We work with clients to understand the issue; we don't prescribe a solution before we fully understand this. We then work with the client to resolve the issue – we believe it's important that the client has ownership of the solution so that it can effectively be taken forward when we leave.

We provide an independent view to clients and focus on people – changing their mindset and improving the way things are done.

Services we provide

Process safety

- We have an ADIL developed Process Safety Framework that focuses on the

application of processes, methodologies and tools to minimise the likelihood, or limit the effects, of a major accident hazard event

Production delivery

- We can work with clients to build an entire operating organisation - finance, legal, commercial, operations and engineering - the entire scope of operations required to run an asset

Production investment

- We can undertake physical due diligence on assets – assess the state of assets and provide recommendations on a work programme on what is required for those assets to perform well

Production optimisation

- We can assess a client's operating processes and procedures and help that client build their own way of operating; in doing this we will improve that client's operating effectiveness

Other services

- We can run workshops and studies for clients and industry bodies
- We have our own suite of standards and processes that are available for clients, 'off the shelf'

How it works.
